Acousto-Optic Devices Principles  
Design

Develops the underlying theory of  
acousto-optics from first principles,  
formulating results suitable for  
subsequent calculations and design.  
Special attention is given to design  
procedures for the entire range of  
acousto-optic devices and a wide  
variety of applications for these  
devices is also described.

Acousto-Optic Devices: Principles, Design, and ...

Introduction. Optics has had a very long and full history, from ancient Greece, through the renaissance and modern times. As with optics, acoustics has a history of similar duration, again starting with the ancient Greeks. In contrast, the acousto-optic effect has had a relatively short history, beginning with Brillouin predicting the diffraction of light by an acoustic wave, being propagated ...

Acousto-optics - Wikipedia

An Acousto-Optic (AO) device is essentially an optical cell with an ultrasonic transducer (generally in the 10s/100s MHz region) bonded to one of its faces. The acoustic beam creates a sinusoidal perturbation of the refractive index of the medium due to the photoelastic effect which acts as a volume diffraction grating.

Acousto Optic basic principles. This website is made to help user to understand basic principles of acousto-optic theory, on which acousto-optic devices are based on. A.A is a world leader in the manufacturing of quality Acousto-optic and radio frequency devices. AA Opto-Electronic offers its customers solutions from prototype design to large volume manufacturing thanks to its internal resources : a large range of standard acousto-optic devices are proposed from UV (180 nm) to far IR (10.6  $\mu\text{m}$ ).

In laser printers and other devices, an AOM can be used for modulating the power of a laser beam. The modulation may be continuous or digital (on/off). Main Acousto-optic modulation principles. AOM is based on the acousto-optic effect, i.e. the modification of the refractive index by the oscillating mechanical pressure of a sound wave.

The proper Bragg angle for each device is tabulated on the individual data sheets. Second, the modulator must be translated vertically so the optical beam passes through the acoustic beam. This adjustment is more critical for the high-performance (wideband) units which have acoustic beams of very small height.

An acousto-optic modulator, also called a Bragg cell or an acousto-optic deflector, uses the acousto-optic effect to diffract and shift the frequency of light using sound waves. They are used in lasers for Q-switching, telecommunications for signal modulation, and in spectroscopy for frequency control. A piezoelectric transducer is attached to a material such as glass. An oscillating electric signal drives the transducer to vibrate, which creates sound waves in the material. These can be thought
