In Velocity, there are three sources for variables, searched in a specific order. The value stack. The action context. Built-in variables. Since the action context is resolved after the value stack, you can reference the variable without the typical preceding marker (#) that has to be used with the JSP s:property tag. Omitting the marker can be convenient, but it can also trip you

Velocity tags are extensions of the generic Struts Tags provided by the framework. You can get jump right in just by knowing the structure in which the tags can be accessed: `#s<tag>` (...), where tag is any of the Struts Tags supported by the framework. For example, in JSP you might create a form using Struts tags.
