But often they know less about a primate that is equally close and just as fascinating — the bonobo, "the forgotten ape." Like chimpanzees, bonobos share more than 98 percent of DNA with humans. But bonobos, though sometimes violent, are more peaceable. They live in matriarchal groups and famously use sex as a social tool — to manage conflict and tension or even just say "hello."

Bonobos have 98.8% of the same DNA as humans (Chimpanzees have 98.6%) yet humans know very little about Bonobos. This well written and beautifully photographed masterpiece can give us very enlightened perspectives.

Primatologist Frans de Waal and wildlife photographer Frans Lanting present the most up-to-date perspective available on the bonobo, the least known of the great apes. 75 color plates.

Describes the habits and behavior of the bonobo, the ape believed to be biologically closest to humans, which has an egalitarian, female-dominant society based on broad sexual contact, and discusses the risks the animals face

A young woman follows her fiancé to war-torn Congo to study extremely endangered bonobo apes—who teach her a new truth about love and belonging. In 2005, Vanessa Woods accepted a marriage proposal from a man she barely knew and agreed to join him on a research trip to the Democratic Republic of Congo, a country reeling from a brutal decade-long war that had claimed the lives of millions. Settling in at a bonobo sanctuary in Congo's capital, Vanessa and her fiancé entered the world of a rare ape with whom we share 98.7 percent of our DNA. She soon discovered that many of the inhabitants of the sanctuary—ape and human alike—are refugees from unspeakable violence, yet bonobos live in a peaceful society in which females are in charge, war is nonexistent, and sex is as common and friendly as a handshake. A fascinating memoir of hope and adventure, *Bonobo Handshake* traces Vanessa's self-discovery as she finds herself falling deeply in love with her husband, the apes, and her new surroundings while probing life's greatest question: What ultimately makes us human? Courageous and extraordinary, this true story of revelation and transformation in a fragile corner of Africa is about looking past the differences between animals and ourselves, and finding in them the same extraordinary courage and will to survive. For Vanessa, it is about finding her own path as a writer and scientist, falling in love, and finding a home. Watch a Video

The bonobo, along with the chimpanzee, is one of our two closest living relatives. Their relatively narrow geographic range (south of the Congo River in the Democratic Republic of Congo) combined with the history of political instability in the region, has made their scientific study extremely difficult. In contrast, there are dozens of wild and captive sites where research has been conducted for decades with chimpanzees. Because data sets on bonobos have been so hard to obtain and so few large-scale studies have been published, the majority of researchers have treated chimpanzee data as being representative of both species. However, this misconception is now rapidly changing. With relative stability in the DRC for over a decade and a growing community of bonobos living in zoos and sanctuaries internationally, there has been an explosion of scientific interest in the bonobo with dozens of high impact publications focusing on this fascinating species. This research has revealed exactly how unique bonobos are in their brains and behavior, and reminds us why it is so important that we redouble our efforts to protect the few remaining wild populations of this iconic and highly endangered great ape species.

The wildly entertaining new novel from the bestselling author of *Water for Elephants*. Sam, Bonzi, Lola, Mbongo, Jelani, and Makena are no ordinary apes. These bonobos, like others of their species, are capable of reason and carrying on deep relationships—but unlike most bonobos, they also know American Sign Language. Isabel Duncan, a scientist at the Great Ape Language Lab, doesn't understand people, but animals she gets—especially the bonobos. Isabel feels more comfortable in their world than she's ever felt among humans . . . until she meets John Thigpen, a very married reporter who braves the ever-present animal rights protesters outside the lab to see what's really going on inside. When an explosion rocks the lab, severely injuring Isabel and "liberating" the apes, John's human interest piece turns into the story of a lifetime, one he'll risk his career and his marriage to follow. Then a reality TV show featuring the missing apes debuts under mysterious circumstances, and it immediately becomes the biggest—and unlikeliest—phenomenon in the history of modern media. Millions of fans are glued to their screens watching the apes order greasy take-out, have generous amounts of sex, and sign for Isabel to come get

them. Now, to save her family of apes from this parody of human life, Isabel must connect with her own kind, including John, a green-haired vegan, and a retired porn star with her own agenda. Ape House delivers great entertainment, but it also opens the animal world to us in ways few novels have done, securing Sara Gruen's place as a master storyteller who allows us to see ourselves as we never have before. BONUS: This edition contains a reader's guide.

The first edition of Frans de Waal's Chimpanzee Politics was acclaimed not only by primatologists for its scientific achievement but also by a much broader audience of politicians, business leaders, and social psychologists for its remarkable insights into very basic human needs and behaviors. In this revised edition—featuring a new gallery of color photographs along with a new introduction and epilogue—de Waal expands and updates his story of the Arnhem colony and its continuing political upheavals. We learn the fate of many memorable chimpanzees and meet the colony's current leaders and their allies. The new edition remains a detailed and thoroughly engrossing account—of sexual rivalries and coalitions, of actions governed by intelligence rather than instinct—and it reaffirms the complex bond between humans and their closest living relatives. As we watch the chimpanzees of Arnhem behave in ways we recognize from Machiavelli (and from the nightly news), de Waal reminds us again that the roots of politics are older than humanity.

"Filippo Aureli and Frans De Waal have succeeded in cross-fertilizing fields as disparate as ethology and medieval law to create a rich new field of research -- natural conflict resolution. It makes one see conflict resolution among humans through a new and fascinating lens. This is a landmark contribution!"—William Ury, co-author Getting to YES, author of Getting Past No and Getting to Peace

Details how, with the unprecedented opening of African forests by European and Asian logging companies, the traditional consumption of wild animal meat in Central Africa has suddenly exploded in scope and impact, moving from what was recently a subsistence activity to an enormous and completely unsustainable commercial enterprise. Although the three African great apes account for only about one percent of the commercial bush meat trade, today's rate of slaughter could bring about their extinction in the next few decades. Eating Apes documents the when, where, how, and why of this rapidly accelerating disaster. In bringing the facts of this crisis and these impending extinctions into a single, accessible book, Peterson takes us one step closer to averting one of the most disturbing threats to our closest relatives.--From publisher description.
