A programmer selects an appropriate data structure and uses it according to their convenience. Let us look into some of these data structures: Array; Stack ; Queue

## What are Data Structures in C and How to use them? | Edureka

The data structures in c is a logical or mathematical model of a particular arrangement or organization of data. In other words, a data structures in c is a particular way of storing data in the computer's memory so that it can be used easily and efficiently. Many different data structures might store the same data, each of which is suited to organize data differently.

Similarly structure is another user defined data type available in C that allows to combine data items of different kinds. Structures are used to represent a record.

Suppose you want to keep track of your books in a library. You might want to track the following attributes about each book – Title; Author; Subject; Book ID; Defining a Structure. To define a structure, you must use the struct statement. The struct statement defines a new data type, with more than one member.

A data structure is a group of data elements grouped together under one name. These data elements, known as members, can have different types and different lengths. Data structures can be declared in C++ using the following syntax: struct type\_name { . member\_type1 member\_name1; member\_type2 member\_name2; member\_type3 member\_name3;
