Example of Rankine Cycle – Problem with Solution. Let assume the Rankine cycle, which is the one of most common thermodynamic cycles in thermal power plants. In this case assume a simple cycle without reheat and without with condensing steam turbine running on saturated steam (dry steam). In this case the turbine operates at steady state with inlet conditions of 6 MPa, $t = 275.6\text{ }^{\circ}\text{C}$, $x = 1$ (point 3).

Problem 4: 2 A reheat Rankine cycle using water as the working fluid operates between the pressure limits of 7.5 kPa and 17.0 MPa. Steam is superheated to 550 o C before it is expanded to the reheat pressure of 4.0 MPa.

One approach to solving cycle problems of this nature is to work your way around the cycle until you have evaluated all the properties to complete the table shown above. Then, you can go back and apply the 1st Law to each process in the cycle to evaluate Q and W s as need. That is the approach I will take.
