In the variational functional framework, a gray-tone image is generally represented by a square-integrable gray-tone function. The basic idea is to consider that the resulting gray-tone image of a processing or an analysis is the solution of a variational problem or, in other words, that this gray-tone function minimizes a suitable functional operating in an appropriate gray-tone function space.

4 Variational Methods in Image Pro-cessing Traditionally, image processing has been investigated via spectral and Fourier methods in the frequency do-main. In the last two decades, variational methods and partial differential equation (PDE) methods have drawn great attention to address a variety of image processing problems including image segmentation,

Conditional Variational Image Deraining. Abstract: Image deraining is an important yet challenging image processing task. Though deterministic image deraining methods are developed with encouraging performance, they are infeasible to learn flexible representations for probabilistic inference and diverse predictions. Besides, rain intensity varies both in spatial locations and across color channels, making this task more difficult.

For the reconstruction step, variational methods are often adopted as it can combine salient features (such as edges) and non-critical regions into a uniform model and solve for a consistent fused image through a stable iterative process.
